

ABSTRACT

One embodiment of the present invention provides a method for testing and monitoring software applications such as naming services, messaging services, publish/subscribe services, authentication/authorization services, transaction services, and the like. The method involves testing multiple elements of the application so as to ease trouble-shooting in the event of failure of some element of the application. A preferred embodiment also gathers performance statistics which can prove useful in analyzing loads and efficiencies of various applications and processes or elements within an application.
